High-energy nuclear collisions

Stefan Floerchinger (Heidelberg U.)

Strategieworkshop Teilchenphysik, Bonn, 03.05.2018

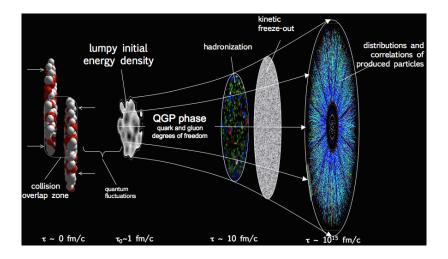

Workshop on June 18-20 https://indico.cern.ch/event/686494/

Little bangs in the laboratory

$A \ great \ challenge$

- quantum fields at finite energy density and temperature
- fundamental gauge theory: QCD
- strongly interacting
- non-equilibrium dynamics
- experimentally driven field of research
- big motivation for theory development

Fluid dynamics

- long distances, long times or strong enough interactions
- matter or quantum fields form a fluid!
- needs macroscopic fluid properties
 - thermodynamic equation of state $p(T, \mu)$
 - shear viscosity $\eta(T,\mu)$
 - bulk viscosity $\zeta(T,\mu)$
 - heat conductivity $\kappa(T,\mu)$
 - relaxation times, ...
- ab initio calculation of fluid properties difficult but fixed by microscopic properties in L_{QCD}

Relativistic fluid dynamics

Energy-momentum tensor and conserved current

$$\begin{split} T^{\mu\nu} &= \epsilon \, u^{\mu} u^{\nu} + (p + \pi_{\mathsf{bulk}}) \Delta^{\mu\nu} + \pi^{\mu\nu} \\ N^{\mu} &= n \, u^{\mu} + \nu^{\mu} \end{split}$$

- \bullet tensor decomposition using fluid velocity $u^{\mu},\,\Delta^{\mu\nu}=g^{\mu\nu}+u^{\mu}u^{\nu}$
- thermodynamic equation of state $p = p(T, \mu)$

Covariant conservation laws $\nabla_{\mu}T^{\mu\nu} = 0$ and $\nabla_{\mu}N^{\mu} = 0$ imply

• equation for energy density ϵ

$$u^{\mu}\partial_{\mu}\epsilon + (\epsilon + p + \pi_{\mathsf{bulk}})\nabla_{\mu}u^{\mu} + \pi^{\mu\nu}\nabla_{\mu}u_{\nu} = 0$$

• equation for fluid velocity u^{μ}

$$(\epsilon + p + \pi_{\mathsf{bulk}})u^{\mu}\nabla_{\mu}u^{\nu} + \Delta^{\nu\mu}\partial_{\mu}(p + \pi_{\mathsf{bulk}}) + \Delta^{\nu}{}_{\alpha}\nabla_{\mu}\pi^{\mu\alpha} = 0$$

 \bullet equation for particle number density n

$$u^{\mu}\partial_{\mu}n + n\nabla_{\mu}u^{\mu} + \nabla_{\mu}\nu^{\mu} = 0$$

$Constitutive \ relations$

Second order relativistic fluid dynamics:

• equation for shear stress $\pi^{\mu\nu}$

 $\tau_{\text{shear}} P^{\rho\sigma}_{\ \alpha\beta} u^{\mu} \nabla_{\mu} \pi^{\alpha\beta} + \pi^{\rho\sigma} + 2\eta P^{\rho\sigma\alpha}_{\ \beta} \nabla_{\alpha} u^{\beta} + \ldots = 0$

with shear viscosity $\eta(T,\mu)$

• equation for bulk viscous pressure π_{bulk}

$$au_{\mathsf{bulk}} u^{\mu} \partial_{\mu} \pi_{\mathsf{bulk}} + \pi_{\mathsf{bulk}} + \zeta \
abla_{\mu} u^{\mu} + \ldots = 0$$

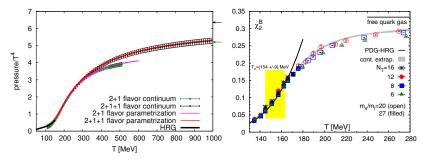

with bulk viscosity $\zeta(T,\mu)$

• equation for baryon diffusion current ν^{μ}

$$\tau_{\text{heat}} \,\Delta^{\alpha}{}_{\beta} \,u^{\mu} \nabla_{\mu} \nu^{\beta} + \nu^{\alpha} + \kappa \left[\frac{nT}{\epsilon+p}\right]^2 \Delta^{\alpha\beta} \partial_{\beta} \left(\frac{\mu}{T}\right) + \ldots = 0$$

with heat conductivity $\kappa(T,\mu)$

Thermodynamics of QCD

[Bazavov et al. (2017), similar Bellwied et al. (2015)]

- thermodynamic equation of state p(T) rather well understood now
- also moments of conserved charges like

$$\chi_2^{\mathsf{B}} = \frac{\langle (N_{\mathsf{B}} - N_{\bar{\mathsf{B}}})^2 \rangle}{VT^3}$$

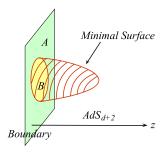

and higher order understood

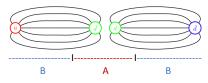

progress in computing power

Quantum fields and information

- surprising relations between quantum field theory and information theory
- well understood in thermal equilibrium
- currently investigated out-of-equilibrium
- fluid dynamics / entanglement entropy / black hole physics (AdS/CFT)
- shear viscosity to entropy density ratio $\eta/s \geq \hbar/(4\pi k_B)$

[Kovtun, Son, Starinets (2003)]

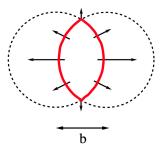

[Berges, Floerchinger, Venugopalan (2017)]

[Ryu, Takayanagi (2006)]

Non-central collisions

- pressure gradients larger in reaction plane
- leads to larger fluid velocity in this direction
- more particles fly in this direction
- can be quantified in terms of elliptic flow v_2
- particle distribution

$$\frac{dN}{d\phi} = \frac{N}{2\pi} \left[1 + 2\sum_{m} v_m \cos\left(m\left(\phi - \psi_R\right)\right) \right]$$

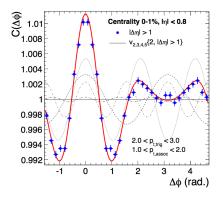

• symmetry $\phi \rightarrow \phi + \pi$ implies $v_1 = v_3 = v_5 = \ldots = 0$.

Two-particle correlation function

• normalized two-particle correlation function

$$C(\phi_1,\phi_2) = \frac{\langle \frac{dN}{d\phi_1} \frac{dN}{d\phi_2} \rangle_{\text{events}}}{\langle \frac{dN}{d\phi_1} \rangle_{\text{events}} \langle \frac{dN}{d\phi_2} \rangle_{\text{events}}} = 1 + 2\sum_m v_m^2 \ \cos(m\left(\phi_1 - \phi_2\right))$$

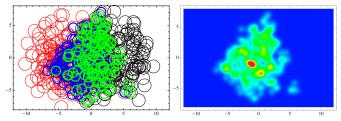

• surprisingly v_2 , v_3 , v_4 , v_5 and v_6 are all non-zero!

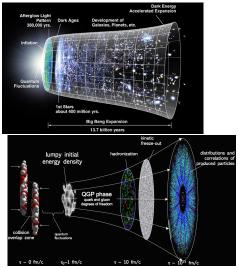

[ALICE 2011, similar results from CMS, ATLAS, Phenix, Star]

Event-by-event fluctuations

- deviations from symmetric initial energy density distribution from event-by-event fluctuations
- one example is Glauber model

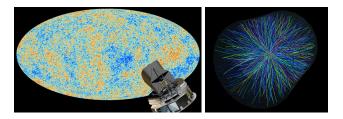

Biq banq – little banq analogy

- cosmol. scale: MPc= 3.1×10^{22} m nuclear scale: fm= 10^{-15} m
- Gravity + QED + Dark sector
- one big event

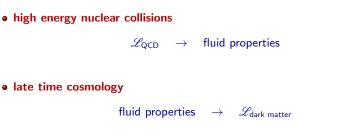

- QCD
- very many events

Similarities to cosmological fluctuation analysis

- fluctuation spectrum contains info from early times
- detailed correlation functions are compared to theory
- can lead to detailed understanding of evolution

The dark matter fluid

• until direct detection of dark matter it can only be observed via gravity

 $G^{\mu\nu} = 8\pi G_{\rm N} \ T^{\mu\nu}$

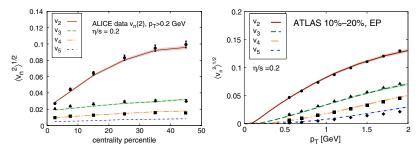

so all we can access is

 $T^{\mu\nu}_{\rm dark\ matter}$

• strong motivation to study heavy ion collisions and cosmology together!

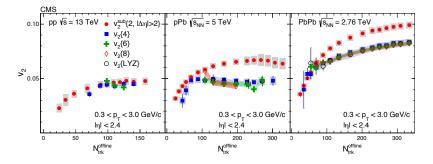

Fluid dynamic simulations

- second order relativistic fluid dynamics solved numerically
- fluctuating initial conditions
- η/s is varied to find experimentally favored value
- differential information in centrality and p_T

[Gale, Jeon, Schenke, Tribedy, Venugopalan (2013)]

Collective behavior in large and small systems

- flow coefficients from higher order cumulants $v_2\{n\}$ agree: \rightarrow collective behavior
- elliptic flow signals also in **pPb** and **pp** !
- can fluid approximation work for pp collisions?

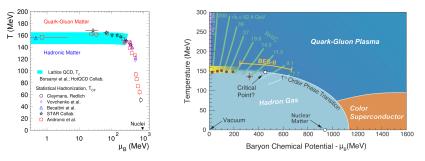

Questions and puzzles

- how universal are collective flow and fluid dynamics?
 - as a limit of kinetic theory / perturbation theory / multi-parton interactions
 - non-perturbative understanding / entanglement
- what determines density distribution of a proton?
 - oconstituent quarks or interacting gluon cloud?
 - generalized parton distribution functions
- what about more elementary collision systems?

- role of electromagnetic fields and vorticity for fluid dynamics
- role of quantum anomalies (e. g. Chiral Magnetic Effect)

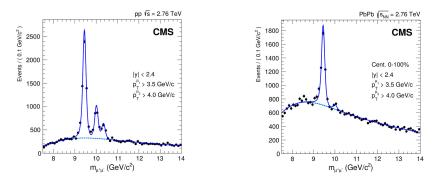

Chemical freeze-out

[Andronic, Braun-Munzinger, Redlich, Stachel (2017)]

- chemical freeze-out close to chiral crossover transition for large \sqrt{s}
- chiral transition should be visible in higher moments $\langle (N_B N_{ar{B}})^n \rangle$
- traces of the evolving chiral condensate / pion condensate ?
- more insights at large μ_B expected from FAIR

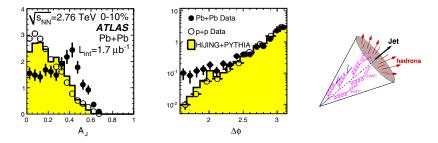

Quarkonium and how it gets modified

• $\mu^+\mu^-$ mass spectrum in the range of $\Upsilon(1S)$, $\Upsilon(2S)$ and $\Upsilon(3S)$

- \bullet all Υ states are suppressed by medium effects, excited states even more
- more detailed understanding of heavy quark bound states in a medium
- also at LHC: regeneration and flow of charmed mesons

Jet quenching

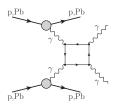

asymmetry between reconstructed jet energies

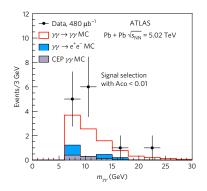

$$A_J = \frac{E_{T1} - E_{T2}}{E_{T1} + E_{T2}}, \qquad \Delta \phi > \pi/2$$

- partons/jets loose energy to the quark gluon plasma
- jet structure investigated in details
- more possible: *b*-jets, *t*-jets
- interplay of microscopic partons / jets and macroscopic QCD fluid

Light-by-light scattering

[ATLAS, Nature Phys. 13, 852 (2017)]

- ultra-peripheral ion collisions produce strong electromagnetic fields
- beam of quasi-real photons (equivalent photon approximation)
- Halpern scattering $\gamma\gamma\to\gamma\gamma$ observed
- also ultra-peripheral: nuclear PDFs

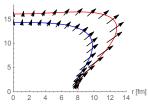

Theory development

- many interesting experimental results available or in reach
- precise studies need interplay of theory and experiment
- more dedicated theory development needed
- we need to develop and maintain a standard model
- heavy ion collisions and QCD dynamics can be understood much better !

Higher energies

[Dainese, Wiedemann (ed.) et al. (2017)]

τ [fm/c]

Quantity	Pb-Pb 2.76 TeV	Pb-Pb 5.5 TeV	Pb-Pb 39 TeV
$dN_{\rm ch}/d\eta$ at $\eta = 0$	1600	2000	3600
Total N_{ch}	17000	23000	50000
$\mathrm{d}E_\mathrm{T}/\mathrm{d}\eta$ at $\eta=0$	1.8-2.0 TeV	2.3-2.6 TeV	5.2-5.8 TeV
Homogeneity volume	5000 fm ³	6200 fm ³	11000 fm ³
Decoupling time	10 fm/c	11 fm/c	13 fm/c
ε at $\tau=1~{\rm fm}/c$	12-13 GeV/fm3	16-17 GeV/fm3	35-40 GeV/fm3

Larger collision energy

- higher initial energy density and temperature
- higher multiplicity $N_{\rm ch}$
- larger lifetime and volume of fireball
- better probes of collective physics
- thermal charm quarks
- more hard probes

A dedicated detector for low p_T ?

- advances in detector technology might allow to construct dedicated detector for low p_T spectrum
- down to $p_T \approx 10 \text{ MeV} \approx \frac{1}{20 \text{ fm}}$?
- low momentum di-leptons
 - \rightarrow excellent understanding of charmonia and bottomonia (P-wave)
 - \rightarrow soft photon theorems
- probe macroscopic properties of QCD fluid: very soft pions, kaons, protons, di-leptons
 - \rightarrow dynamics of chiral symmetry restoration
 - \rightarrow pion condensates / disoriented chiral condensates ?
- understand thermalization and dissipation in detail
 - \rightarrow spectrum also at $p_T \ll T_{\text{kinetic freeze-out}} \approx 120 \text{ MeV}$
 - \rightarrow spectral distortions ? (cf. current discussion in cosmology)

The high energy nuclear collision experiments landscape

present

- LHC (ALICE / ATLAS / CMS / LHCb)
- RHIC (Star / Phenix)
- SPS (NA61/SHINE)
- SIS (HADES)

future (approved)

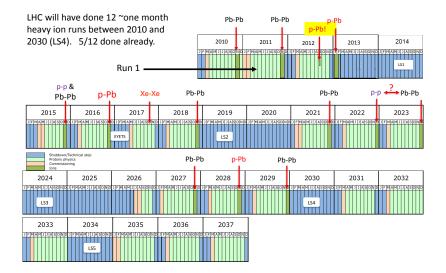

- GSI/FAIR (CBM)
- JINR/NICA (MPD, BM@N)

future (proposed)

- sPhenix (RHIC)
- Electron-Ion collider in the USA (eRHIC / JLEIC)

CERN schedule

[J. M. Jowett, 10/2017]

Conclusions

- high energy nuclear collisions produce a relativistic QCD fluid!
- interesting parallels between cosmology and heavy ion collisions
- chance to understand a relativistic fluid from first principles
- experimental hints for collective flow also in pPb and pp collisions
- interesting to study also smaller energy / higher baryon density regime
- QCD fluid can be understood in much more detail with combined effort of theory and experiment!
