Functional renormalization group equations and analytic continuation

Stefan Flörchinger (CERN)

École Polytechnique Paris, 30 Janvier 2014

Introduction

The quantum effective action

Schwinger functional from functional integral

$$e^{W[J]} = \int D\varphi \; e^{-S[\varphi] + \int_x J\varphi}$$

• Generates *connected* correlation functions, e.g.

 $\frac{\delta^2}{\delta J(x)\delta J(y)}W[J] = \langle \varphi(x)\varphi(y)\rangle_c = \langle \varphi(x)\varphi(y)\rangle - \langle \varphi(x)\rangle\langle \varphi(y)\rangle$

Quantum effective action by Legendre transform

$$\Gamma[\phi] = \int_x J\phi - W[J], \qquad \text{with} \qquad \phi = \frac{\delta W[J]}{\delta J}.$$

- Generates one-particle irreducible correlation functions: Propagators and vertices obtained by functional derivatives of Γ[φ] can be used in tree-level expressions to yield exact correlation functions.
- Contains renormalized masses, coupling constants etc.
- Thermodynamic and transport properties follow from $\Gamma[\phi]$, as well.

How do we obtain the quantum effective action $\Gamma[\phi]$?

Idea of functional renormalization: $\Gamma[\phi] \to \Gamma_k[\phi]$

• k is additional infrared cutoff parameter.

•
$$\Gamma_k[\phi] \to S[\phi]$$
 for $k \to \infty$

• $\Gamma_k[\phi] \to \Gamma[\phi]$ for $k \to 0$.

Э

Flowing action

Modified Schwinger functional

$$e^{W_k[J]} = \int D\varphi \ e^{-S_k[\varphi] - \frac{1}{2}\int_p \varphi(-p) R_k(p) \varphi(p) + \int_x J\varphi}$$

• $R_k(p)$ is infrared cutoff function,

$$\lim_{p^2 \to 0} R_k(p) \approx k^2, \qquad \lim_{p^2 \to \infty} R_k(p) = 0,$$
$$\lim_{k \to 0} R_k(p) = 0, \qquad \lim_{k \to 0} R_k(p) = \infty.$$

Flowing action defined as

$$\Gamma_k[\phi] = \int_x J\phi - W_k[J] - \frac{1}{2} \int_p \phi(-p) R_k(p) \phi(p)$$

• Interpolates between classical action and quantum effective action

$$\lim_{k \to \infty} \Gamma_k[\phi] = S[\phi],$$
$$\lim_{k \to 0} \Gamma_k[\phi] = \Gamma[\phi].$$

How the flowing action flows

Simple and exact flow equation (Wetterich 1993)

$$\partial_k \Gamma_k[\phi] = \frac{1}{2} \mathsf{STr} \left(\Gamma_k^{(2)}[\phi] + R_k \right)^{-1} \partial_k R_k.$$

- Differential equation for a functional.
- For most cases not solvable exactly.
- Approximate solutions can be found from Truncations.
 - Ansatz for Γ_k with a finite number of parameters.
 - Derive ordinary differential equations for this parameters or couplings from the flow equation for Γ_k .

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ つ ・

• Solve these equations numerically.

Truncations

Main truncation schemes usually employed are

• Derivative expansion

$$\Gamma_{k} = \int_{x} \left\{ U_{k}(\varphi^{*}\varphi) + Z_{k} \varphi^{*}(-\partial_{\mu}\partial^{\mu})\varphi + \dots \right\}$$

Vertex expansion

$$\Gamma_k = \int_q \varphi^*(q) P_k(q) \varphi(q) + \int_{q_1..q_4} A_k(q_1,..,q_4) \varphi^*(q_1) \varphi(q_2) \varphi^*(q_3) \varphi(q_4) + \dots$$

- Momentum dependence of vertices is crucial but this gets quickly complicated...
- One needs a way to take the most important structures into account.

Problems with momentum dependence

Numerical schemes to resolve the momentum dependence face various problems

- Symmetries / Ward identities
- Numerical effort
- Singularities
- Spontaneous symmetry breaking
- Analytic continuation to real frequencies
- Unitarity and Causality
- Physical interpretation

Idea followed here: Concentrate on physical important singular structures.

Bound states

▲□▶ ▲圖▶ ▲臣▶ ▲臣▶ 臣 のへで

Motivation

• Formation of bound states was one of the first problems discussed in quantum mechanics

1. Quantisierung als Eigenwertproblem; von E. Schrödinger.

- Bound state formation is much more difficult to treat in Quantum field theory.
- Bethe-Salpeter equation can be used to sum Ladder diagrams but it is difficult to go beyond.

▲ロ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ● ○ ○ ○

• Good alternatives needed!

Flow equations and Bound states

• Wetterich's flow equation was used by Ellwanger to study bound states in the Wick-Cutkosky model.

(U. Ellwanger, Z. Phys. C 62, 503 (1994).)

• Wegner's flow equation for Hamiltonians was used to investigate bound states in two dimensions

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ つ ・

(S. D. Glazek and K. G. Wilson, PRD 57, 3558 (1998).)

 Partial bosonization and k-dependent, non-linear field transformations were used for the NJL-model (H. Gies and C. Wetterich, PRD 65, 065001 (2002).) Four point function in QED

• Exact four point function in QED

• Two very different contributions

Photon exchange

• Bound state formation

Perturbative QED point of view

▲ロ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ● ○ ○ ○

- Bound state formation is non-perturbative
- Bethe-Salpeter equation allows to resum parts of this

Quantum mechanics point of view 1

• Integrate photon out, take non-relativistic limit

$$\frac{-e^2}{(\vec{p}-\vec{p'})^2} \sim \frac{-e^2}{4\pi |\vec{x}_1-\vec{x}_2|}$$

Schrödinger equation

$$H\psi = E\psi$$

Hamiltonian

$$H = \frac{1}{2(m_e + m_P)} (\vec{p}_e + \vec{p}_P)^2 + \frac{1}{2\mu} \vec{p}_r^2 + V$$

• Solution gives series of bound states

$$H\psi_{nlm} = E_n\psi_{nlm}$$
$$\psi_{nlm} = R_{nl}(r)Y_{lm}(\Omega_{\vec{r}})$$

▲ロ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ● ○ ○ ○

Quantum mechanics point of view 2

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ つ ・

Limits are

- Only instantaneous interactions
- No radiation corrections
- Not Lorentz invariant

Unified treatment

Should describe both

- Perturbative QED (High energies / momenta)
- Bound states (Small energy / momenta)

Basic ideas

- Introduce auxiliary fields for the orbitals
 - simple description of bound states
 - efficient treatment of singular momentum structure

A D F A 目 F A E F A E F A B F A Q A

- Keep photon exchange picture for interaction
 - retardation effects
 - radiation corrections
 - simple scattering theory for large energies
- On large scale only photon exchange
 - introduce orbitals gradually during flow

Can be done with flowing bosonization.

Flowing bosonization

• Start with QED + auxiliary fields for bound states

- Auxiliary fields decouple at the microscopic scale $h_{\Lambda} = 0$.
- Need one auxiliary field for every orbital j = (n, l, m).
- For instantaneous photon $(c \to \infty)$:
 - Yukawa vertex depends on relative velocity of electron and proton

$$h_j = h_j \left(\vec{p}/m_e - \vec{q}/m_P \right)$$

Propagator matrix depends on center of mass momentum

$$G_{jj'} = G_{jj'}(p+q).$$

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ つ ・

Flowing bosonization with exact flow equation 1

Exact flow equation

$$\partial_k \Gamma_k = \frac{1}{2} \mathsf{STr}(\Gamma_k^{(2)} + R_k)^{-1} (\partial_k R_k - R_k (\partial_k Q^{-1}) R_k) - \frac{1}{2} \Gamma_k^{(1)} (\partial_k Q^{-1}) \Gamma_k^{(1)}.$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

(S. Floerchinger and C. Wetterich, PLB 680, 371 (2009).)

- Derived from *k*-dependent Hubbard-Stratonovich transformation.
- Γ⁽¹⁾_k is functional derivative with respect to the composite field.
- $\partial_k Q^{-1}$ can be chosen arbitrary.

Flowing bosonization with exact flow equation 2

• Flow of four point function can be absorbed by convenient choice of $\partial_k Q^{-1}$.

 $\bullet\,$ This modifies flow of coupling h and bound state propagator

Flowing bosonization with exact flow equation 3

- For non-relativistic particles with instantaneous interaction one can solve the flow equations. Equivalence to Schrödinger equation can be shown (S. Floerchinger, Eur. Phys. J. C 69, 119 (2010)).
- For k = 0 the effective four-point function has two main contributions

▲ロ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ● ○ ○ ○

- Fundamental fields and composite fields are treated equal.
- This allows to treat
 - Interactions between composite fields
 - Spontaneous symmetry breaking
 - Bound states of composite fields

Analytic continuation

Why analytic continuation

- Physical propagating degrees of freedom are characterized by a pole or cut in the correlation function.
- A pole in the propagator corresponds to a stable particle, a cut corresponds to a resonance.
- Many technical methods e.g. to perform Matsubara summations use the analytic structures and at the end one needs the residue at a pole or the integral along a cut.
- Idea: Concentrate on the singular structures and describe them by as few parameters as possible.

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ つ ・

Physics takes place in Minkowski space

- Many singular structures can only be properly seen in Minkowski space. (In Euclidean space there are some at $\vec{p} = 0$ for massless particles or at Fermi surfaces.)
- Numerical approaches have difficulties with singularities and try to avoid them as far as possible (and therefore usually work in Euclidean space).
- But: Singularities in correlation functions are physical and very important. We should not be afraid of them!
- Functional renormalization as a semi-analytic method has the potential to cope well with singularities but is mainly used in Euclidean space so far.
- Idea followed here: Derive flow equations directly for real time properties by using analytic continuation.

Different strategies for analytic continuation

- 1. Extend formalism to Minkowski space functional integral
- 2. Keep on working with Matsubara space functional integral, use analytic continuation at k = 0.
- 3. Keep on working with Matsubara space functional integral, use analytic continuation of flow equations.

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ つ ・

Strategy 1: Extend formalism to Minkowski space

some technical problems

- factors i appear at various places
- $-p_0^2 + \vec{p}^2$ is not positive definite: what is IR and what is UV?
- not obvious how to choose $R_k(p)$ such that

 $\lim_{k \to \infty} \Gamma_k[\phi] = S[\phi]$

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ つ ・

- needs Schwinger-Keldysh closed time contour
 - technically involved formalism
 - averaging over initial density matrix sometimes difficult
- can be used also in far-from-equilibrium situations

Strategy 2: Work with functional integral in Matsubara space and use analytic continuation at k = 0

- can be done with numerical techniques: Padé approximants or maximal entropy methods
- numerical effort rather large
- knowledge about spectral properties does not improve RG running
- only linear response properties accessible
- some results already available:
 - N. Dupuis, PRA 80, 043627 (2009).
 - A. Sinner, N. Hasselmann, P. Kopietz, PRL 102, 120601 (2009).

- R. Schmidt, T. Enss, Phys. Rev. A 83, 063620 (2011).
- M. Haas, L. Fister, J. M. Pawlowski, arXiv:1308.4960

Strategy 3: Work with functional integral in Matsubara space and use analytic continuation of flow equations

- no numerical methods needed for analytical continuation
- truncations with only a few parameters that parameterize efficiently the quasi-particle properties can be used

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

- flow equations for real-time properties
- space-time symmetries can be preserved
- only linear response properties accessible

Follow this strategy here!

Analytic structure of the effective action

Consider the Quantum effective action

$$\Gamma[\phi] = \int_x J\phi - W[J].$$

The propagator

$$\Gamma^{(2)}(p,p') = (2\pi)^d \delta^{(d)}(p-p') \ G^{-1}(p)$$

has the Källen-Lehmann spectral representation

$$G(p) = \int_0^\infty d\mu^2 \ \rho(\mu^2) \frac{1}{p^2 + \mu^2}$$

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ つ ・

This holds both for

- Euclidean space: $p^2 = \vec{p}^2 + p_4^2$
- Minkowski space: $p^2 = -p_0^2 + \bar{p}^2$

Propagator in Minkowski space

Consider $p_0 \in \mathbb{C}$ as complex. Close to real p_0 axis one has

• From spectral representation

$$P(p) = G(p)^{-1} = P_1(p_0^2 - \vec{p}^2) - i\,s(p_0)\,P_2(p_0^2 - \vec{p}^2)$$

with

$$s(p_0) = \operatorname{sign}(\operatorname{Re} p_0) \operatorname{sign}(\operatorname{Im} p_0)$$

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ つ ・

and real functions P_1 and P_2 .

- Nonzero P₂ leads to a branch cut in the propagator: The imaginary part of P(p) jumps at the real p₀ axis.
- Physical implication of non-zero P_2 is non-zero decay width of quasi-particles (finite life-time).

Analytic continuation setup

- Keep on working with Euclidean space functional integral.
- Definition of Γ_k and flow equation remains unchanged,

$$\partial_k \Gamma_k[\phi] = \frac{1}{2} \operatorname{Tr}(\Gamma_k^{(2)}[\phi] + R_k)^{-1} \partial_k R_k.$$

- \bullet Choose cutoff function R_k with correct properties for Euclidean argument $p^2 \geq 0$
 - $R_k(p^2) \to \infty$ for $k \to \infty$ (implies $\Gamma_k[\phi] \to S[\phi]$)
 - $R_k(p^2) \to 0$ for $k \to 0$ (implies $\Gamma_k[\phi] \to \Gamma[\phi]$)
 - $R_k(p^2) \ge 0$, $R_k(p^2) \to 0$ for $p^2 \gg k^2$

• Flow equations for *n*-point functions

$$\Gamma_k^{(n)}(p_1,...,p_n)$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

are analytically continued towards the real frequency axis.

• Truncation uses expansion around real p_0 (Minkowski space).

Derivative expansion in Minkowski space

- Consider a point $p_0^2 \vec{p}^2 = m^2$ where $P_1(m^2) = 0$.
- One can expand around this point

$$P_1 = Z(-p_0^2 + \bar{p}^2 + m^2) + \cdots$$

 $P_2 = Z\gamma^2 + \cdots$

• Leads to Breit-Wigner form of propagator (with $\gamma^2=m\Gamma$)

$$G(p) = \frac{1}{Z} \frac{-p_0^2 + \vec{p}^2 + m^2 + i \, s(p_0) \, m\Gamma}{(-p_0^2 + \vec{p}^2 + m^2)^2 + m^2 \Gamma^2}.$$

• A few flowing parameters describe efficiently the singular structure of the propagator.

・ロト ・ 戸 ・ ・ ヨ ・ ・ ヨ ・ ・ クタマ

Choosing a regulator

- The analytic properties of correlation functions at k > 0 depend on the choice of $R_k(p)$.
- One would like to perform loop integrations analytically as far as possible to facilitate analytic continuation.
- Useful are the following choices

$$R_k(p_0, \vec{p}) = Zk^2 \frac{1}{1 + c_1 \left(\frac{-p_0^2 + \vec{p}^2}{k^2}\right) + c_2 \left(\frac{-p_0^2 + \vec{p}^2}{k^2}\right)^2 + \dots}.$$

• Allows to do the Matsubara summations analytically for truncation based on derivative expansion.

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ つ ・

Truncation for relativistic scalar O(N) theory

$$\begin{split} \Gamma_k &= \int_{t,\vec{x}} \left\{ \sum_{j=1}^N \frac{1}{2} \bar{\phi}_j \, \bar{P}_{\phi}(i\partial_t, -i\vec{\nabla}) \, \bar{\phi}_j \right. \\ &+ \frac{1}{4} \bar{\rho} \, \bar{P}_{\rho}(i\partial_t, -i\vec{\nabla}) \, \bar{\rho} + \bar{U}_k(\bar{\rho}) \bigg\} \end{split}$$

with $\bar{\rho} = \frac{1}{2} \sum_{j=1}^{N} \bar{\phi}_{j}^{2}$.

 $\bullet\,$ Goldstone propagator massless, expanded around $p_0-\vec{p}^2=0$

$$\bar{P}_{\phi}(p_0, \vec{p}) \approx \bar{Z}_{\phi} \ (-p_0^2 + \vec{p}^2)$$

• Radial mode is massive, expanded around $p_0^2 - \vec{p}^2 = m_1^2$

$$\bar{P}_{\phi}(p_0, \vec{p}) + \bar{\rho}_0 \bar{P}_{\rho}(p_0, \vec{p}) + \bar{U}'_k + 2\bar{\rho}\bar{U}''_k \approx \bar{Z}_{\phi} Z_1 \left[(-p_0^2 + \vec{p}^2 + m_1^2) - is(p_0) \gamma_1^2 \right]$$

Flow of the effective potential

$$\begin{split} \partial_t U_k(\rho) \Big|_{\bar{\rho}} &= \frac{1}{2} \int_{p_0 = i\omega_n, \bar{p}} \left\{ \frac{(N-1)}{\bar{p}^2 - p_0^2 + U' + \frac{1}{\bar{Z}_{\phi}} R_k} \right. \\ &+ \frac{1}{Z_1 \left[(\bar{p}^2 - p_0^2) - i \, s(p_0) \gamma_1^2 \right] + U' + 2\rho U'' + \frac{1}{\bar{Z}_{\phi}} R_k} \right\} \frac{1}{\bar{Z}_{\phi}} \partial_t R_k. \end{split}$$

- Summation over Matsubara frequencies $p_0 = i2\pi Tn$ can be done using contour integrals.
- Radial mode has non-zero decay width since it can decay into Goldstone excitations.
- Use Taylor expansion for numerical calculations

$$U_k(\rho) = U_k(\rho_{0,k}) + m_k^2(\rho - \rho_{0,k}) + \frac{1}{2}\lambda_k(\rho - \rho_{0,k})^2$$

Conclusions

▲□▶ ▲圖▶ ▲臣▶ ▲臣▶ 臣 のへで

Conclusions

- Functional renormalization is powerful method for non-perturbative QFT studies.
- Analytic continuation allows to access directly physical information in real time.
- Together with k-dependent Hubbard-Stratonovich transformation this will allow for efficient truncations with few parameters taking all singular structures into account.

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ つ ・

- Bound states can be treated as well.
- Allows unified treatment of fundamental and composite fields.
- Would be interesting to make connection to RG in light cone coordinates (DGLAP).
